MAGNETIC TREATMENT OF CONCENTRATER

In using magnets supplied by Ray Page of P.S. Australian Promotions (trading as Magnetic Technology), we have observed various operational improvements which have the potential to reduce cleaning costs and improve product quality.

The magnets were applied to the evaporation process, concentrating both cheese whey and skim milk, prior to spray drying. Removal of existing buildup was observed and when an evaporator was clean to begin with, it remained clean.

The magnets were used on two of our plants for a combined operating time of 10 weeks. The next step is aimed at placing magnets on two evaporators permanently to detail the actual savings.

The results from this will determine further installations
